Clinical AI QA: P3 Fix Report

Source: Clinical AI QA Test Report (8 Nov 2026) | Commit dc56962 (12 Nov)

Result: all 11 P3 items are fixed and deployed. One sub-point is left by design: the hospital list still shows only fictional demo hospitals (Issue 25).

P3 status against the QA list

Issue	QA request	Status	What was done
12	SEO basics and a real 404	**Fixed**	Real robots.txt (text/plain) and sitemap.xml (application/xml), a title per page, Open Graph, canonical and hreflang tags. Unknown URLs return 404.
14	Arabic on public pages	**Fixed**	Public and legal pages are translated, with a language switch in the site header. Choosing Arabic sets lang="ar" and dir="rtl".
15	Intake form range checks and a working Save draft	**Fixed**	Inline range errors as you type (for example age 0–120, SpO2 50–100, systolic BP 40–300). Save draft saves on the server, confirms, and restores per clinician, including for a patient not admitted yet.
16	Intake assistant captures all vitals and labs	**Fixed**	Heart rate, respiratory rate, SpO2, temperature, potassium and symptoms are now captured. Anything it could not map is listed as "Not captured" before "Run assessment".
18	Smaller issues	**Fixed**	A physician is sent away from nurse-only pages. The Design system link is gone from the public footer and shows only for admin and ops staff. "Sixteen roles" and the Evidence typo are fixed. The app uses the real clock.
21	Sharing accepts an invalid recipient	**Fixed**	The UI and the API refuse a recipient that is not a valid email or a hospital from the list.
22	Patient export leaves out the patient's own data	**Fixed**	The export now includes intake submissions, requests and access history. The page says it is ESAP's own JSON layout, not yet FHIR.
23	Requests go to a care team that does not exist	**Fixed**	For a patient with no hospital, corrections and other requests go to the ESAP support queue, and the app says so.
24	Times shown in the future ("in 47 d")	**Fixed**	Bootstrap sends the real current time, so access history and requests show correct times.
25	Smaller patient-portal issues	**Fixed**	Arabic gaps translated. Emergency text gives 997. A patient's bootstrap holds only their own identity. Every /admin path refuses non-admins. Patient two-factor is no longer relevant (removed 14 Nov). Fictional demo hospitals remain, by design.
26	"Design system" footer link opens a blank page	**Fixed**	Link removed from the public footer. A signed-out visit to /design goes to the sign-in page.

Also fixed (results table)

Close my account: typing CLOSE now really closes the account. It used to only sign the person out.

Verification

Check	Result
Backend tests (14 Nov, after two-factor removal)	357 passed, including the P2/P3 tests in test_qa_p2, test_qa_followup and test_release_check
Frontend tests	203 passed, 9 skipped
Typecheck and production build	Clean
Live site checks (14 Nov)	robots.txt text/plain, sitemap.xml application/xml, unknown URL 404, OG and canonical tags present

Deployment: the backend and frontend fixes went live on 12 Nov (commit dc56962).

QA retest guide

Issue	Retest steps and expected result
12	Open /robots.txt, /sitemap.xml and /no-such-page-qa. Expect a text file, an XML file and a 404. View source on /product for og: and canonical tags and a page-specific title.
14	On /product use the language switch in the header and choose Arabic. Expect Arabic text and right-to-left layout on /product, /privacy and /terms.
15	New encounter > Age 250 > Tab: expect an inline error. Click Save draft: expect a confirmation, then leave and reopen to see the draft restored.
16	Assistant: the Issue 16 message (BP 150/95, HR 102, RR 22, SpO2 94%, temp 36.9, creatinine 1.4, sodium 137, potassium 4.3). Expect every value captured, and any unmapped text listed under "Not captured".
18	As a physician open /nurse/roster: expect a redirect. Check the public footer has no Design system link, and /security has no "Sixteen roles".
21	Share & consent > Give someone access > Who: not-an-email. Expect an error and no grant.
22	My records > Structured file. Expect submissions, requests and access history in the file.
23	As a self-serve patient, ask for a correction. Expect a message that it went to ESAP support, not the care team.
24	Share & consent > Who actually looked. Today's events show as minutes or hours ago, not "in 47 d".
25	In Arabic, check the Connect box, access-history labels and symptom chips. As a patient, GET /api/v1/admin/interop: expect 403.
26	Signed out, open the footer: no Design system link. Go to /design: expect the sign-in page.

Remaining before the pilot

- **Hospital list:** it offers only fictional demo hospitals until real hospitals are onboarded.
- **FHIR export:** the export is ESAP's own JSON. FHIR is not built yet.
- **Arabic review:** a native speaker should review the new Arabic public and legal text.
