1. Project Summary

1.1 Overview

ESAP Clinical AI is a **cloud-based (SaaS) healthcare platform**. It brings AI-powered insights, hospital care teams, patients and other hospitals together in one place. Hospitals subscribe and go live without installing anything, and each hospital gets its own secure, private space on the platform.

Item	Details
Product type	AI-powered clinical decision support and care collaboration platform (SaaS)
Category	Healthcare AI / Clinical Decision Support / Healthcare SaaS
Industry	Healthcare: hospitals, health systems, clinicians and patients
Stage	Work in Progress. The product is live as a working demo, and the AI models are still being improved.

1.2 The problem it solves

In a busy hospital, the first hours of a patient's stay matter most, yet the full picture of a patient often takes time to build. Care teams must decide quickly who needs closer attention, who may need intensive care and how to plan the stay. ESAP closes that gap by giving the team an **early, explained picture of every patient within seconds of admission**.

1.3 What the AI does

Staff enter the information available when a patient arrives: age, how the patient arrived, vital signs, first blood tests, past conditions, current medicines and the admission note. ESAP then gives five early insights:

#	Insight	Question it answers
1	**Possible conditions**	Which conditions may the patient already have? (ranked list)
2	**Risk of death**	How likely is the patient not to survive the hospital stay?
3	**Intensive care**	How likely is the patient to need the ICU?
4	**Return to hospital**	How likely is the patient to be readmitted within 30 days?
5	**Length of stay**	How long is the patient likely to stay?

1.4 What makes it different

- **Explained, not a black box:** every insight has a **"Why?"** button showing what drove it, so staff can check the reasoning.
- **Honest about reliability:** the product says openly when an insight is less reliable, instead of hiding it.

- **Fair by design:** insights are checked regularly across patient groups to make sure no group is treated unfairly.
- **Uses only admission-time information:** nothing learned later in the stay is used, so the insights are realistic at the moment they are needed.
- **Supports, never replaces, the clinician:** a doctor always reviews the insight and makes the final decision.

1.5 Before admission: patients and individual users

ESAP is useful even before a patient is admitted:

- Patients can **create their own account, choose a hospital and ask to connect** with it.
- They can **describe their symptoms and share their details before a visit**, so the care team is prepared.
- A clinician **accepts the request** and turns it into an admission.
- **Individual doctors** can sign up on their own, without a hospital, to try the insights.

1.6 Hospital-to-hospital collaboration

A hospital can **request a patient's records from another hospital** directly from the patient's page. The receiving hospital **reviews and approves** the request before anything is shared. Every exchange is based on the **patient's consent** and is recorded in the audit log.

1.7 Who uses it: four areas, 15 job roles

Each person sees only the area and the screens their job needs:

Area	Users	What they do
Clinical workspace	Doctors, residents, nurse practitioners, nurses, pharmacists, case managers	Admit patients, review AI insights, record vital signs, manage tasks, hand over shifts, plan discharge
Hospital admin console	Hospital admin, IT admin, privacy officer, billing admin, quality auditor	Manage staff and roles, wards, system connections, audit log, fairness checks, usage and billing
Platform console	ESAP team	Onboard and monitor all customer hospitals, manage plans, roll out AI updates, handle incidents
Patient portal	Patients, families and caregivers	Plain-language results, records, messages to the care team, sharing and consent (English and Arabic)

1.8 Key features at a glance

For care teams

- Patient worklist with search and filters, plus quick new admissions
- Admission form with sample patients and condition/medicine search

- **AI chat assistant:** describe a patient in plain words and the form fills itself in
- Review and sign-off, with senior doctors countersigning trainees' work
- Patient timeline and history, vital signs, tasks and escalation
- Shift handover notes and discharge planning
- Release reviewed results to the patient

For hospital administrators

- Staff invitations, roles and access control; facilities and wards
- Connections to existing hospital systems, including staff single sign-on
- Full audit log, fairness checks, usage reports and billing

For patients and families

- Self sign-up, pre-visit check-in and plain-language results
- Medical records, with correction requests and requests for records from other hospitals
- Messages to the care team, sharing and consent controls, and family/caregiver access
- English and Arabic

For the ESAP team (SaaS management)

- All hospitals in one view, onboarding in a few steps, plans and subscriptions
- Gradual roll-out of AI updates, incident tracking, and emergency access with second-person approval

Across the platform

- Strict role-based access, two-step login and a full activity record
- Light and dark mode, phone-friendly screens, and a public website with product, evidence, security and pricing pages

1.9 Target customers and pricing (proposed)

Customer	Plan	Price
Individual clinicians	Free / Pro	$0 / $39 per month
Hospitals (trial)	Hospital Pilot: 90 days, up to 25 users	$18,000
Hospitals	Essential / Professional	$34 / $48 per bed per month
Large health systems	Enterprise	Custom pricing

Hospital plans include unlimited staff users. Pricing is proposed and not final.

1.10 Scope of work delivered

The platform was built end to end by the team: the AI, the product, the security model and the testing.

Area of work	What was delivered
AI research and training	Five AI models designed around a strict "admission-time only" rule, developed using **546,000+ real (anonymised) hospital admissions** from the MIMIC-IV research database. Every model is checked for accuracy, reliability and fairness, and tested against "too good to be true" results.
Product design	**60+ screens** across four product areas, with one consistent design system, light and dark mode, phone-friendly layouts, and a refreshed brand identity and logo.
Clinical workflows	Admission, AI review and sign-off, vital signs, tasks and escalation, shift handover, discharge planning, and release of results to patients.
Patient experience	A full patient portal in **English and Arabic** (including right-to-left layout), with self sign-up, pre-visit check-in, family access and consent controls.
Hospital and SaaS operations	A hospital admin console and an ESAP platform console: staff and roles, audit log, fairness checks, billing, hospital onboarding, plans, AI roll-outs and incident handling.
Collaboration	Patient-to-hospital connection requests and hospital-to-hospital record exchange with approval and consent.
AI chat assistant	Staff and patients can describe a case in plain words, and the form fills itself in.
Security and privacy	**15 job roles**, each with precisely defined access, enforced on the server as well as the screen. Includes two-step login, single sign-on, emergency access that needs a second person's approval, and a full audit trail.
Quality assurance	Every role was tested screen by screen, and **30+ issues were found and fixed**. Automated checks run on every change: 150+ system tests, 160+ screen tests and a 196-point live check of the whole system.
Deployment	Live on **care.esap.ai** and Vercel, connected to a live server.

1.11 Current status

- ✅ All four areas, all 15 roles and the patient portal (English and Arabic) are built and live.
- 🔄 AI model training is still in progress for some of the insights.

2. Live URLs

Type	URL	Status
Custom domain (primary)	https://care.esap.ai	✅ Live
Vercel URL	https://esap-intelligent-ai-healthcare-r6cz.vercel.app	✅ Live

Both addresses serve the same, latest version of the product (checked 1 October 2026).

3. Login Credentials

Login page: https://care.esap.ai/login

All people and patients in the demo are fictional. The demo hospital is **St. Yves Medical Center**.

Clinical workspace

Role	Email	Password	Opens on
Attending Physician *(recommended start)*	`amara.okonkwo@styves.example`	`esap-demo`	Worklist
Resident / Fellow	`tobias.lindqvist@styves.example`	`esap-demo`	Worklist
Nurse Practitioner / PA	`priya.raman@styves.example`	`esap-demo`	Worklist
Charge Nurse	`ines.vasquez@styves.example`	`esap-demo`	Unit risk roster
Staff / Bedside Nurse	`lucas.beaulieu@styves.example`	`esap-demo`	My patients
Care Coordinator / Case Manager	`noor.haddad@styves.example`	`esap-demo`	Discharge planning
Clinical Pharmacist	`ezra.stein@styves.example`	`esap-demo`	Worklist

Hospital admin console

Role	Email	Password	Opens on
Hospital Admin	`mira.novak@styves.example`	`esap-demo`	Home
IT Admin	`kofi.mensah@styves.example`	`esap-demo`	Integrations
Compliance / Privacy Officer	`sanne.devries@styves.example`	`esap-demo`	Audit log
Billing Admin	`hugo.ferreira@styves.example`	`esap-demo`	Billing
Quality / QI Auditor	`leila.aziz@styves.example`	`esap-demo`	Usage & outcomes

Platform console

Role	Email	Password	Opens on
Super-Admin (ESAP Platform)	`rmoravec@esap.health`	`esap-demo`	Fleet dashboard

Patient portal

Role	Email	Password	Opens on
Patient / Caregiver	`delia.salib@example.com`	`esap-demo`	My health
Individual / Self-serve	*Create a new account via Sign up***	*Set during sign-up*	My health

To switch role: click your name (top right) → **Sign out**, then sign in with another email. The sign-in page also has a **"Demo — sign in as any role"** card for one-click access.

---

4. Walkthrough: What to Click After Login

Total time: about 20 minutes. Start at **https://care.esap.ai** and click **Sign in**.

A. Doctor (about 8 min): `amara.okonkwo@styves.example`

1. On the **Worklist**, look at the patients on ward 4-West. Try the **My patients / Whole unit** switch and the search box.
2. Click any **patient**. The **Results** page shows the five AI insights.
3. Click **"Why?"** on any insight to see what drove it. Note the **reliability label** on each one (the readmission insight is labelled "degraded" on purpose).
4. Click **Acknowledge** → **Confirm review** to record that you reviewed the results.
5. Click **Go to intake**. In **Load a sample patient**, choose **Cardiac · 68M**; the whole form fills in. Click **Run assessment**.
6. In the left menu, click **New encounter** to admit a new patient. Fill in the name, a record number (e.g. `MRN-900001`), the ward and the bed, load a sample, then click **Admit & run assessment**. The patient appears on the worklist.
7. Click the **chat button** (bottom right) and type: "*72 year old man, came through the ED, BP 90/60, history of heart failure*". Then click **Run assessment from this**.
8. On a patient's page, click **Request record from elsewhere** to ask another hospital for the patient's records.
9. In the left menu, open **Discharge planning**. Patients are ranked by their chance of returning to hospital.
10. **Sign out.**

B. Nurses (about 4 min)

11. Sign in as the Charge Nurse (`ines.vasquez@styves.example`). The **Unit risk roster** shows every patient on the ward, ordered by risk.
12. Open **Handoff summary** and write a shift handover note. **Sign out.**
13. Sign in as the Staff Nurse (`lucas.beaulieu@styves.example`). On **My patients**, click **Vitals** next to a patient and record a new set of vital signs. **Sign out.**

C. Hospital Admin (about 5 min): `mira.novak@styves.example`

14. On **Home**, review the open requests and activity.
15. Open **Roster** to see the staff list, roles and access, and invite a new staff member.
16. Open **Interop & transfer**. The record request from step 8 is here; click **Approve** or **Reject**.
17. Open **Facilities & units**, **Integrations** and **Org settings** to see how the hospital is configured.
18. Open **Fairness audit**, **Usage & outcomes** and **Billing**. **Sign out.**
19. *(Optional)* Sign in as the Privacy Officer (`sanne.devries@styves.example`) and open the **Audit log**. Every action from the steps above is recorded there.

D. Patient (about 3 min): `delia.salib@example.com`

20. On **My health**, see the plain-language summary. *(Optional: try Tell us how you feel to check in before a visit.)*
21. Open **My results**. Only results a clinician has released are shown. Try **Ask a question**.
22. Open **My records**, **Care team**, **Share & consent** (who can see your records) and **Family access** (invite a caregiver).
23. Switch the language to **العربية** in the top bar; the page changes to Arabic, right to left. **Sign out.**

E. ESAP Platform Admin (about 2 min): `rmoravec@esap.health`

24. Open **Fleet dashboard** to see all customer hospitals in one view. Click a hospital for its details.
25. Look through **Provisioning wizard** (onboard a new hospital), **Plan catalog**, **Model rollout**, **Incidents** and **Break-glass** (emergency access that needs a second person's approval).

---

5. Known Issues & Pending Items

Known issues

#	Item	Impact
1	**AI insights on the live site are demonstration values.** The live server runs in demo mode, not with the trained models.	Numbers look realistic and behave consistently, but they are not real model predictions.
2	**Shared demo data.** All visitors use the same demo hospital, so changes (new patients, invites, notes) are visible to everyone.	Data may look different from this guide if others have used the demo. It can be reset before a client presentation.
3	**"Dictate / describe" on the intake form** does not extract fields yet; it asks follow-up questions instead.	Use the **chat assistant** (step 7) for the same experience.
4	**Hospital brand colour** can be chosen in Org settings but does not yet change the app's colours.	Cosmetic only.
5	**NP/PA and Pharmacist** are not on the one-click demo card.	Sign in with their email instead.

Pending items

- **AI model training is still in progress** for some of the insights.
