Clinical AI QA: P1 Fix Report

Source: Clinical AI QA Test Report | Commit 1066df3

Result: 6 of the 7 P1 items are fixed and deployed. Issue 1 (shared demo password and public demo-accounts list) has not been changed. The demo access was kept on deliberately, so this pilot blocker is still open.

P1 status against the QA list

Issue	QA request	Status	What was done
1	Remove and rotate the shared demo password, turn off the public demo-accounts list	**Not fixed**	No change. The **/demo-role** page and shared demo login stay on for QA and because this code is moving to another production repo. Must be closed before the pilot.
19	Patient assistant detects red flags (chest pain, breathing, stroke) and gives an emergency message with 997	**Fixed**	Every patient chat message is checked in English and Arabic using fixed rules that do not depend on the LLM. A match shows the emergency message with 997. The intake form also warns on typed symptoms.
20	Intake form has no pre-set answers and shows "Not answered" for skipped questions	**Fixed**	Duration, getting worse and had-this-before start blank. Skipped questions and medicines show "Not answered" to the patient and the clinician.
4	Placeholder models: "Placeholder, not for clinical use" banner, "AI-generated" label, no calibrated: true, hide 0.000 metrics	**Fixed**	Banner and label added. Placeholder models never send calibrated: true, and earlier saved results are corrected at backend start. Metrics that were never computed no longer show as 0.000.
5	Default unit for solo and self-serve accounts so a patient can be admitted	**Fixed**	Self-serve accounts get a default "My practice" unit. Each solo clinician sees only the patients they admitted.
6	Stop sending all users' names and emails to non-admins	**Fixed**	Non-admin staff receive only their own user record and demo identity from bootstrap. Admins keep the full roster.
2	Rewrite Security page and FAQ to list only what is built, with the rest under "Planned"	**Fixed**	Security page is split into "Built today" and "Planned", and states that no certification is held. FAQ answers were corrected.

Needed to close Issue 1

Once QA no longer needs demo access: set a new password for the demo accounts, remove the shared one, and turn off the demo picker (**ESAP_DEMO_PICKER**) together with the **/demo-role** route. Turning off the picker alone does not change the password.

Verification

Check	Result
Backend tests	268 passed, including 39 P1 tests
Frontend tests	195 passed
Typecheck	Clean
Live-API integration tests	9 passed against a live backend
Chrome run of the QA scenarios on a database copy	Passed in light and dark, at desktop and phone widths

Deployment: the backend and frontend fixes are in production.

QA retest guide

Issue	Retest steps and expected result
19	Patient portal > Assistant > send "I am 55 and have chest pain and my left arm hurts. Am I having a heart attack? What is my risk score?" Expect the emergency message with 997, with Age 55, Chest pain and Arm pain captured.
20	"Tell us how you feel" > pick one symptom > press Next on every step > Finish > open "Ready to share". Expect "Not answered" for each skipped question.
4	Needs a build running placeholder models. Production serves trained models, so the banner does not appear there and trained results may correctly be calibrated. Run an assessment, confirm no calibrated: true, then open /evidence and confirm no 0.000 values or "Cohort n = 0".
5	Sign up as a solo physician > New encounter. Expect "My practice" selected and the patient admitted. A second solo account must not see that patient.
6	Sign in as a physician > DevTools > Network > bootstrap. Expect one entry in users and one in demo_identity.
2	Open /security and /faq. Confirm AES-256, mutual TLS, hash-chained audit, a BAA and a penetration test summary are not claimed as existing today.

Remaining before the pilot

- **Clinical sign-off:** a clinician should review the red-flag list, and a native speaker the Arabic terms and messages.
- **Emergency alerts:** the patient sees the warning, but no one on the care team is notified.
- **Security page facts:** HTTPS on the hosted demo and "not hosted in Saudi Arabia" come from project documents and were not tested on the live server.
- **Same claims elsewhere:** outside the Security page and FAQ, the legal pages, Pricing page and some admin and ops screens still state items such as AES-256 encryption, mutual TLS, hash-chained audit or a BAA. Legal pages are Issue 3 in P2. The others have no ticket yet.
